

## SPADE CONNECTORS

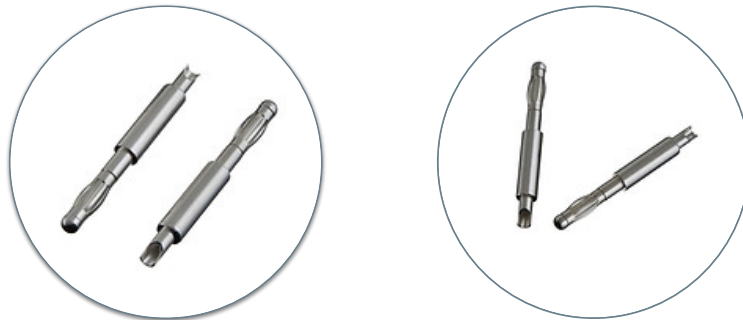

---

Our Spade connectors are press formed from non-magnetic metal then heavily plated in high purity Silver to the same standard as our RCA connectors, binding posts etc. For heavy gauge cables or for those looking for a particularly solid connection that will remain in place for a long period, they are the perfect choice. Cable connection is via soldering, and a deep solder bucket is pressed into the rear of the plug. They are not colour coded, so appropriate heatshrink markers will need to be applied during installation.

## BANANA PLUGS

---

Our Banana plugs are machined from non-magnetic solid bar, then fitted with a spring tension 'lantern' at the tip to provide a reliable, constant contact with the socket of any standard 4mm entry binding post. As with all of our connectors, they are heavily plated with high purity Silver. Cable connection is via soldering, and a deep solder bucket is machined into the rear of the plug. They are not colour coded, so appropriate heatshrink markers will need to be applied during installation.
