## Signal Enhancers

The Quantum Signal Enhancer by Bybee Technologies will transform any audio or video component and audio system to a higher level of performance with quantum proton alignment.

This QSE will last a lifetime without losing effectiveness. The Bybee-QSE is a compact (4 X 6 X 1/4 Inch) attractive walnut wood panel, with a felt-covered bottom

The QSE affects the polarity of all electrons and protons within it's magnetic field, affecting their oscillation by making them more aligned with each other. This reaction creates an affect the makes the transfer or sharing of electrons more streamline and efficient. In audio, the results are faster and more impactful bass frequencies with more extended high frequencies that are open and natural, without edginess. The critical midrange sounds become more musical, more liquid and less "electronic." The overall presentation of imaging and sound staging becomes both more precise and more enveloping.

This device is typically placed under/over any kind of signal-carrying wire(s), or components, or power supplies. The QSE works even with heavily shielded audio cables designed to withstand RFI/EMF noise from the electrical grid.

One QSE may be used with multiple signal-carrying wires; there is no need to have a QSE on each wire. The effects of the QSE are accumulative, so multiple QSEs will continue to improve system and room performance. Video also benefits from this device.
