Bullet Kit

This product kit is designed for OEM speaker manufacturers, audio modifiers and DIY hobbyists seeking a higher level of speaker performance. This Speaker Bullet Kit will deliver stunning improvement in detail retrieval, ambience and spatial presentation, vocal and instrumental color, transient and dynamic impact, and harmonic completeness. It is designed to be installed internally in the speakers and placed after the speaker terminals and before the crossover network.

The Internal Speaker Bullet Kit is an equally high-performance alternative to the critically acclaimed Bybee Plug-in Speaker Bullets product.

Each Internal Speaker Bullet Kit contains two Internal Speaker Bullets for the positive legs and two Large Regular Purifiers for the negative legs. The Positive elements are the Internal Speaker Bullet with one-inch leads. The Negative elements, for maximum sonic performance and quieting on the return leg of the connection, are the Large Regular Quantum Purifier. One package of the Internal Speaker Bullet Kit treats a pair of single-wired loudspeakers. Bi-wire speakers require two Kits.

For the audiophile who demands the absolute best performance attainable, a Positive and Negative pair may be installed right at each transducer rather than just before the crossover network after the binding post.
